### Basic Bioinformatics Sessions

#### Practical 4: Primer Design

Tuesday 24 October 2017

## Primer Design

The prime intention of this exercise is to design a way to amplify a DNA fragment of reasonable size that includes a specific portion of the **PAX6** gene. The target region is that which includes the mutation you glanced at earlier, that is a major cause of Aniridia. That is, the substitution that mutates the **33<sup>rd</sup>** amino acid position of the **PAX6** human protein. I remind that the details you discovered earlier are as follows:

<u><b>Affected Patient:</b></u>	<u><b>33<sup>rd</sup> amino acid position</b></u>	<u><b>mRNA Base position</b></u>
	<b>Proline (P)</b>	<b>459 (CCT)</b>
<u><b>Wild Type:</b></u>	<u><b>33<sup>rd</sup> amino acid position</b></u>	<u><b>Genomic DNA Base position</b></u>
	<b>Alanine (A)</b>	<b>15915 (GCT)</b>

The isolation, amplification and analysis of the target region of the genome could be affected by using **restriction enzymes**. In this case, there is more than one restriction enzyme whose cut site is dependant upon the mutation and so would produce a differing set of **restriction fragments** when used with the DNA of **Aniridia** affected patients to that normally expected. As long as those differences were course enough to be detected by a **Restriction Fragment Length Polymorphism (RFLP)** experiment. Software exists to select enzymes to isolate a chosen region of genomic DNA and to fragment that isolate in such a way it is possible to determine whether it includes the unfortunate mutation or not from the pattern of fragments generated.

For a variety of reasons, including the ready availability and ever decreasing cost of sequencing, this is typically not the preferred way to proceed. It is normally preferable to use **Polymerase Chain Reaction (PCR)** to isolate the region around the mutation and then to sequence samples from all individuals under examination. To do this, the first step would be to design suitable **PCR primers**. One program, in many different forms, is almost exclusively used for this purpose. The program is **primer3**. It is free and can be downloaded and run under linux and windows (at least). It is available as part of the **EMBOSS** package (**eprimer3**) and from a number of websites, including at the **Massachusetts Institute of Technology (MIT)**<sup>1</sup>:

<http://bioinfo.ut.ee/primer3/>

This site is popular with many users wanting the very latest version of the software, complete control over the various options offered by **primer3** and are not too concerned with using a database search to check the uniqueness of the products they will produce.

Another excellent **primer3** web interface developed in the Netherlands is available at:

<http://www.bioinformatics.nl/cgi-bin/primer3plus/primer3plus.cgi>

The site incorporates access to a **blast** search to check the uniqueness of the selected primers (important if unwanted **PCR** products are to be avoided).

Mostly because of its completely seamless inclusion of a **blast** search to compare potential primers with appropriate sequence collections, I suggest we here use **primer3** as implemented at the **NCBI**, even though it offers less than complete control over the execution of **primer3** itself. **Go to:**

<http://www.ncbi.nlm.nih.gov>

Click on the **BLAST** option. Select

from the **Specialized BLAST** section.

<sup>1</sup> The MIT link here is to the latest version of **primer3** (version 4.0.0, soon **primer4** maybe?).

Upload your genomic **PAX6** sequence using the **Browse** (or **Choose File**) button for the **PCR Template**.

You have established that the mutation of greatest interest is the **G/C** substitution at position **15915** of the genomic sequence copied from **Ensembl**. It is logical therefore to specify that this feature be included in the **PCR** product not too near either end. Accordingly, request the **Forward primer** to be chosen **From** the region starting at base pair **15150** and **continuing To** base pair **15850**. Set the range for the **Reverse primer** to be **From 15950** and **To 16650**.

The default **PCR product size** is specified in the **Primer Parameters** section as between **70** and **1000** base pairs. This seems fine.

I would not presume to advise you on the melting temperatures that were most suitable<sup>2</sup>. For this exercise, the defaults work splendidly.

By default, **primer-BLAST** will report the best **10** primer pairs it can find (**# of primers to return**). This is plenty for the exercise.

Do you think **10** primer pair suggestions is sufficient? If not, what number would you choose?

In addition to running **primer3** to suggest primers, **Primer-BLAST** checks against the possibility of unwanted **PCR** products by comparing potential primers against an appropriate sequence database with **blast**.

In the **Primer Pair Specificity Checking Parameters** section, set the **Database** selection to **RefSeq representative genomes**. Leave the **Organism** set as **Homo sapiens**.

You thus request each potential pair of **PCR** primers to be compared to the entire human genome. Thus unintended products of similar size to the intended product, can be identified.

The ideal conclusion is “just one product will be produced, on chromosome **11**, in the region of the **PAX6** gene”.

Use the appropriate ⓘ button to discover the purpose of the **Max target size** parameter.

This is a relatively new parameter replacing a very different parameter, the purpose of which was somewhat less obvious. The reason for the **Max target size** parameter is surely pretty transparent, so maybe there is now less requirement to wake up its ⓘ button? For the present, the maximum size of any proposed **PCR** product, in this instance, is **1,000** base pairs (the form default). So the greatest size of an unwanted product that might be a problem (the **Max target size**) must be small enough to potentially be mistaken for a real product of **1,000** base pairs. **4,000** base pairs seems a bit cautious to me? However, unless you feel strongly about the matter, accept the default value of **4000**.

What value would you choose here if you were looking for uncluttered results?

<sup>2</sup> My policy has been to not discuss parameters that pertain to the experimental conditions. In future versions of these notes, I will include discussion of some of these parameters. In the mean time, the ⓘ buttons are very helpful. I would also suggest the **MIT** site (or the **Wageningen** site) for very readable explanations linked from every parameter. The full **primer3** manual can be found [here](#).

Before setting **primer-BLAST** going, click on the **Advanced parameters** button. Not really so **Advanced**? More **Avoidable** by those in a hurry. At the top are the **Primer Pair Specificity Checking Parameters** that control the way that **blast** is run. Note the  buttons offering explanation.

Note the very high default **Blast expect (E) value**, suggesting you will be interested in matches with your primers that might occur up to **30000** times by chance! This does make sense as the primers will be very short and so many good, even exact, “chance” matches might be expected against a large database. You are essentially requesting that exclusion of results with high **Expect Scores** be disabled.

Comment upon the small default value for the **blast word size**?

Primer Pair Specificity Checking Parameters	
Max number of Blast target sequences	50000 
Blast expect (E) value	30000 
Blast word size	7 
Max primer pairs to screen	500 
Max targets to show (for designing new primers)	20 
Max targets to show (for pre-designed primers)	1000 
Max targets per sequence	100 

Internal hybridization oligo parameters			
Hybridization oligo	<input type="checkbox"/> Pick internal hybridization oligo		
	Min	Opt	Max
Hyb Oligo Size	18	20	27
	Min	Opt	Max
Hyb Oligo tm	57.0	60.0	63.0
	Min	Opt	Max
Hyb Oligo GC%	20.0	50	80.0

Note that you could get **primer-BLAST** to suggest an **Internal hybridisation oligo**, but decline the invitation this time.

Accept all the **Advanced parameters** as they are. Ask **primer-BLAST** to **Show results in a new window**.

Click on the **Get Primers** button.

<b>Get Primers</b>	<input checked="" type="checkbox"/> Show results in a new window <input checked="" type="checkbox"/> Use new graphic view 
--------------------	---

After a few moments of deep thought, **primer-BLAST** will notice that the template sequence you are using is **highly similar** (identical in fact) to part of an entry in the database being searched. Hardly surprising if one was to think about it. The **RefSeq** entry identified is the **PAX6 RefSeqGene** sequence you examined in a previous exercise.

You are invited to select all listed regions (just one this time) where matches with primers are likely to be the intended product. In this case, that is the whole list of one, so click on the **All** button. Every pair of primers that **primer3** selects **must** match this region

Input PCR template		pax6_genomic dna:chromosome chromosome:GRCh38:11:31783579:31819262:-1				
Range		15750 - 17250				
Your PCR template is highly similar to the following sequence(s) from the search database. To increase the chance of finding specific primers, please review the list below and select all sequences (within the given sequence ranges) that are intended or allowed targets.						
Select: <a href="#">All</a> <a href="#">None</a> Selected: 1						
Accession	Title	Identity	Alignment length	Seq. start	Seq. stop	Gene
<input checked="" type="checkbox"/> NC_000011.10	Homo sapiens chromosome 11, GRCh38.p7 Primary Assembly	100%	1501	31802013	31803513	<a href="#">PAX6</a>
<b>Submit</b>		<input checked="" type="checkbox"/> Show results in a new window				

of **Chromosome 11** as it is precisely the region investigated by **primer3** in the first place. This process avoids **blast** reporting intended products as unintended products.

Finally, all is ready, so ask to **Show results in a new window** once more and then click on the **Submit** button.

Once you have revelled in the opportunity to twiddle the fingers and scratch the ear(s) whilst **primers3** and **blast** go merrily about their appointed tasks, you will receive your results. These should look disarmingly like mine if all has gone well.

The summary **Graphic view** suggest just **2** solutions met the default criteria for success used by **primer3**. Up to **10** were permitted<sup>3</sup>.

Hover your mouse over one or more and further details will pop up in separate windows.

Primer 1	Primer 2
<p><b>Forward:</b> 15827..15846 length 20 Tm 59.75 GC 55.00% Seq AGGTCACAGCGGAGTGAATC</p> <p><b>Reverse:</b> 16514..16534 length 21 Tm 60.07 GC 52.38% Seq GCTGACCTTGCTTAAAGTGGC</p> <p><b>PCR product length:</b> 708</p>	<p><b>Forward:</b> 15610..15629 length 20 Tm 60.53 GC 60.00% Seq GATAGCAGGGAAGTACC GC</p> <p><b>Reverse:</b> 16512..16531 length 20 Tm 58.76 GC 50.00% Seq GACCTTGCTTAAAGTGGCGT</p> <p><b>PCR product length:</b> 922</p>

Neither of your suggested primer pairs are reported with any unintended products, even given the very generous suggestion that products **4000** bases long should be considered a potential problem<sup>4</sup>.

<sup>3</sup> Which rather makes mock of all the deep thought employed deciding upon the most sensible maximum number of predictions to be reported.

<sup>4</sup> This was not true until recently. **Primer-BLAST** reported many more primer pair suggestions and quite a few unintended products for each. The previous parameter restriction the length of unintended products was substantially more generous.

As well as suggesting primers for PCR (or other purposes) and (optionally) suggesting hybridisation oligos, **primer-BLAST** can be used to evaluate user-selected primers. Earlier, you saved a pair of primer sequences associated with **PAX6** when searching the nucleotide databases at the **NCBI**. It would be interesting to discover the product these might produce. To do this you need an unsullied **Primer-BLAST** page. Go again to:

<http://www.ncbi.nlm.nih.gov>

Click on the **BLAST** option. Select

from the **Specialized BLAST** section.

Upload your genomic **PAX6** sequence using the **Browse** (or **Choose File**) button for the **PCR Template**.

**Primer Parameters**

Use my own forward primer (5'→3' on plus strand)  [Clear](#)

Use my own reverse primer (5'→3' on minus strand)  [Clear](#)

PCR product size Min  Max

# of primers to return

Primer melting temperatures (Tm) Min  Opt  Max  Max Tm difference

Open up the file you made containing the primers from **GenBank** (**pax6\_primers.fasta**) in a text editor.

**Copy and Paste** the two primer sequences into the **Use my own forward primer** and **Use my own reverse primer** boxes as appropriate.

**Primer Pair Specificity Checking Parameters**

Specificity check ☒ Enable search for primer pairs specific to the intended PCR template

Search mode

Database

Exclusion ☐ Exclude predicted Refseq transcripts (accession with XM, XR prefix) ☐ Exclude uncultured/environmental sample sequences

Organism   
Enter an organism name (or organism group name such as enterobacteriaceae, rodents), taxonomy id or select from the suggestion list as you type.

Entrez query (optional)

Primer specificity stringency Primer must have at least  total mismatches to unintended targets, including at least  mismatches within the last  bps at the 3' end. Ignore targets that have  or more mismatches to the primer.

Max target size

Splice variant handling ☐ Allow primer to amplify mRNA splice variants (requires refseq mRNA sequence as PCR template input)

In the **Primer Pair Specificity Checking Parameters** section, set the **Database** selection to **RefSeq representative genomes**.

Leave the **Organism** as **Homo sapiens**.

Raise the **Max target size** parameter from **4000** to **20000**. You should check for enormous unintended products with this run of **Primer-BLAST**. The reasons for this will soon become apparent.

Ask **primer-BLAST** to **Show results in a new window**. Click on the **Get Primers** button.

**Get Primers**

☒ Show results in a new window ☒ Use new graphic view

After a short thrill filled pause, you will receive a result that should again looks more that a trifle like mine.

**Primer 1**

Forward: 12237..12261 length 25 Tm 69.45 GC 60.00% Seq  
CCAGCCAGAGCCAGCATGCAGAACA

Reverse: 24963..24988 length 26 Tm 64.96 GC 50.00% Seq

Reverse primer	GGTTGGTAGACACTGGTGCTGAAACT	Minus	26	24988	24963	64.96	50.00	4.00	1.00
Product length	12752								
Products on potentially unintended templates									
>NC_000011.10 Homo sapiens chromosome 11, GRCh38.p7 Primary Assembly									
product length = 12752									
Features associated with this product:									
<a href="#">paired_box_protein Pax-6 isoform a</a>									
<a href="#">paired_box_protein Pax-6 isoform a</a>									
Forward primer	1	CCAGCCAGAGCCAGCATGCAGAACA	25						
Template	31806426	.....	31806482						
Reverse primer	1	GGTTGGTAGACACTGGTGCTGAAACT	26						
Template	31793675	.....	31793700						

Seemingly a fine match. Even the single **potentially unintended product** reported is actually the **intended product**. For some reason, **Primer-BLAST** does not eliminate predictable intended products when investigating user specified primers?

Success! However, applying a small measure of sober reflection, one has to wonder at a **PCR** product of **12,752** base pairs? I suspect that to be just a tad on the boastful side of probable? Clearly, **primer-BLAST** is convinced, but maybe a look at the references that came with these primer sequences would be advised before accepting this result.

5 I have asked the guys at **NCBI** to explain. No full answer as yet, further prodding required. Prodded last **2016.04.02**. Maybe I give up?

6 Apparently, such a PCR product is possible! However, above **5,000** base pairs would be slow, require very close attention and be prone to errors.

Reading the only paper referenced seems a little like hard work! Better by far to investigate the only sensible reason for the prediction of such an outrageously large PCR product, by experiment. A sensible conjecture is that the primers you saved were designed for use with mRNA/cDNA data. Therefore it might be interesting to run **primer-BLAST** one last time with **pax6\_mrna.fasta** as the **PCR Template**.

Move back to your last **primer-BLAST** launch page. This time, load **pax6\_mrna.fasta** as the **PCR Template**.

In the **Primer Pair Specificity Checking Parameters** section, set the **Database** selection set to **Refseq mRNA** and leave the organism set to **Homo sapiens**.

Set the **Max target size** back to its default value of **4000**, you should expect much smaller mRNA products this time, so no need for extending this maximum beyond **4000**.

These selections suppose that the design of **PCR** product was for selection from a library of all human cDNAs.

Ask **primer-BLAST** to **Show results in a new window**.

Click on the **Get Primers** button.

Get Primers

Show results in a new window

Use new graphic view

The result is a much more reasonable **Product length** of just **908** base pairs, reinforcing the theory that these primers were indeed designed for use with a cDNA library.

Template 443 ..... 467

Reverse primer 1 GGTGGTAGACTGGTGCTGAAACT 26
Template 1350 ..... 1325
```

The first thing to note is that the template (the mRNA sequence in the file **pax6\_mrna.fasta**) is not a **RefSeq** mRNA. It comes from the **GenBank** database and so was included in the “non-redundant” union of databases you searched earlier.

**Genbank** sequences are generally generated directly from a specific sequencing project. **RefSeq** mRNAs are generally consensus sequences computed from the evidence represented by **Genbank** sequences. Consequently, there is no unintended product that we can ignore because it relates to the original template sequence.

All the unintended products could/would potentially be generated by the primers under investigation and have the potential to cause confusion. If you look down the list, you should conclude that the **9** unintended products come from **9** of the **11 RefSeq PAX6** transcripts found in the databases by test search and later detected by **blast**.

Why do you suppose **blast** did not pick up all the transcripts?

Note that the intended product is **908** base pairs long. Note that all the unintended products are either **908** long or **950** long. A difference of **42**.

How would you tell quickly which isoform was represented by each mRNA listed here?

Some fairly redundant questions to finish this section. I think I have already answered them all. But maybe you might wish to differ?

For all the “**potentially unintended products**”, the selected primers match exactly. Can you explain this?

## Model Answers to Questions in the Instructions Text.

### Notes:

For the most part, these “**Model Answers**” just provide the reactions/solutions I hoped you would work out for yourselves. However, sometime I have tried to offer a bit more background and material for thought? Occasionally, I have rambled off into some rather self indulgent investigations that even I would not want to try and justify as pertinent to the objective of these exercises. I like to keep these meanders, as they help and entertain me, but I wish to warn you to only take regard of them if you are feeling particularly strong and have time to burn. Certainly not a good idea to indulge here during a time constrained course event!

Where things have got extreme, I am going to make two versions of the answer. One starting:

### Summary:

Which has the answer with only a reasonably digestible volume of deep thought. Read this one.

The other will start:

### Full Answer:

Beware of entering here! I do not hold back. Nothing complicated, but it will be long and full of pedantry.

This makes the Model answers section very big. **BUT**, it is not intended for printing or for reading serially, so I submit, being long and wordy does not matter. Feel free to disagree.

## From your investigations of Primer Design

Do you think **10** primer pair suggestions is sufficient? If not, what number would you choose?

Until a few years ago, the default here was **5**. That seemed rather low to me. I included this question to solicit opinion rather than to impart knowledge. A default of **10** seems more in line with my instincts, but people who use this program seriously mostly tell me that they can select suitable primers from the first **2** or **3** suggestions of the program. So, **5** would seem a good choice and **10** would be moving towards cautiously overdoing things.

On the whole, informed opinion suggests that **10** suggestions will be more than enough in most circumstances.

What value would you choose here if you were looking for uncluttered results?

### Summary:

Clearly, the smaller the number chosen, the shorter will be the list of spurious products. However, pick something too small and you risk including unintended product(s) that could cause confusion. The size selected must be sufficient that larger unwanted PCR product(s) could easily be spotted by other means (simply by size?).

### Full Answer:

Well, mostly for me, and just in case you were curious, when I first wrote the question, the parameter was very different and not so easy to understand. Pure self indulgence, I know, but here is the history. The parameter explained itself, via the ⓘ button, thus:

Misprimed product size deviation	<input type="text" value="4000"/> ⓘ This specifies the size variation of the off-target PCR products relative to that of your intended PCR product. Only those primer pairs producing an off-target PCR product within the specified range will be tagged as non-specific.
----------------------------------	---

I interpreted this to mean that only **blast** predicted products of up to **X+4,000** base pairs, where **X** base pairs is the length of the intended target, will be given any regard. It is thus assumed that a difference of **4,000** base pairs between an intended PCR product (predicted by **primer3**) and a spurious product (detected by **blast**) can easily be detected simply by size difference.

Of course this parameter also will reject unwanted **blast** predicted products that are less than **X-4,000** base pairs will be given any regard. Given the largest possible **primer3** suggestion will be **1,000** base pairs (the form setting for the exercise specifies products of between **100**<sup>7</sup> and **1,000** base pairs), this is hardly an issue here.

Comment upon the small default value for the **blast word size**?

By default, **blast** will be looking for aligned exactly matching blocks of **7** nucleotides when identifying where a primer might match a database entry. The entire primer match with the template sequence does not have to be exact for the primer to be acceptable. The entire primer is typically only around **20** bases long. And word size much more than **7** would clearly miss too much to be effective.

Why do you suppose **blast** did not pick up all the transcripts?

Well, the simple answer is that the transcripts that were not detected as unwanted products cannot include either the forward primer, or the reverse primer, or both. This is, almost, the only possible explanation.

I have a huge **Full Answer:** for this one that needs either throwing away or bringing up to date. I think I was the only one who ever read it, so you miss little while I decide its fate.

How would you tell quickly which isoform was represented by each mRNA listed here?

All the mRNAs reported were of length **908** or **950**.

A reasonable guess might be based on the length of the products? All those that are **908** bases might be assume to produce the **422** amino acid **canonical isoform**. All those that are **950** (i.e. **42** base pairs longer) might be assumed to **436** produce amino acid **isoform 5a** proteins (i.e. **14** amino acids longer).

Just a guess of course, but one I would be happy to have faith in. To be certain, one would need to read the annotations of each listed **RefSeq** entry!

<sup>7</sup> The form explicitly declares a minimum of **70**, but the ranges from which the **forward** & **reverse** primers must come (**15000-15700** & **15800-16500**) make the smallest possible **primer3** prediction **100** base pairs long.

Is the number of “**potentially unintended products**” as you would expect, given the evidence from **Entrez** and **blast**?

Yes, I think so, given you accept my investigation (see above) as to why there were only **16** “**potentially unintended products**” when you might have expected **24**, given your **blast** results. **GeneCards** now encourages an initial expectation of **24** “**potentially unintended products**”. **Ensembl** only uses the higher quality **RefSeq** mRNAs. Currently, **Ensembl** uses **10** of the **11** good quality **RefSeq** mRNAs to make its transcripts predictions. Close enough?

For all the “**potentially unintended products**”, the selected primers match exactly. Can you explain this?

Well, of course they do??? All the transcripts found are generated from the same region of genomic DNA and therefore will be identical in all shared regions, including the primer regions. I suppose, in other instances, it would be possible to have transcripts with variation in the regions matching the primers insufficient to stop the primers working? But not in this case.

One might conclude there are no genuinely “unintended” products? All are real **PAX6** transcripts. A genuine unintended product would come from an entirely different part of the genome and would not necessarily match exactly with respect to the primers. They would just need to be “good enough to work”.
